- signals traditionally used for diagnostic medicine
  - emotional state: heart rate, skin resistance
  - brain sensing technology cognitive and emotional state (BCI - brain computer interaction):
    - electroencephalography (EEG)
    - functional near-infrared spectroscopy (fNIR)
  - signals generated by muscle activation
    - electromyography (EMG)
    - bone conduction
      - sound frequencies propagate well through bone

**HMD**

fabrication

teaching

shape-changing

mobile  
projection

# Principle: closed (video only) HMD

- Monitor is mounted very close to the eye
- Additional lens makes it appear distant
- ➔ all images appear at the same distance
  - Usually at infinity or slightly less

sensors

**HMD**

fabrication

teaching

shape-changing

mobile  
projection

- Lag and jitter between head motion and motion of the 3D scene
  - Due to tracking → predictive tracking
  - Due to rendering → nowadays mostly irrelevant
- Leads to different motion cues from
  - Eye (delayed) and
  - Vestibular system (not delayed)
- Result: cyber sickness

# Oculus Rift

context and task

theory

interaction  
techniques

**in/output  
technologies**

sensors

**HMD**

fabrication

teaching

shape-changing

mobile  
projection

- custom-built motion and orientation sensor unit
  - gyroscope
  - accelerometer
  - magnetometer
- head tracking with 3 degrees of freedom

# Creating AR with video see-through HMDs

context and task

theory

interaction techniques

**in/output technologies**

sensors

**HMD**

fabrication

teaching

shape-changing

mobile projection

# Advantages of video-based see-through

- Lag between physical and virtual image can be compensated
- Camera can be used for tracking as well
  - Physical image = raw tracking data
  - Perfect registration possible
- Video mixer can add or subtract light
  - Virtual objects can be drawn in black
  - Physical objects can be substituted
  - Virtual objects can be behind physical objects
- Just one image with a given focus distance

# Challenges of video-based see-through

context and task

theory

interaction  
techniques

**in/output  
technologies**

sensors

**HMD**

fabrication

teaching

shape-changing

mobile  
projection

- Lag between physical and virtual image can be compensated
  - ...by delaying the physical image
  - Leads back to the cyber sickness problem
- Parallax error can not be corrected electronically
  - Wrong stereo cues when used for stereo
- Richness of the world is lost
  - Video image just 0.5 megapixels
  - Resolution of human vision is much higher (>10x)

# Creating AR with optical see-through HMDs

context and task

theory

interaction techniques

**in/output technologies**

sensors

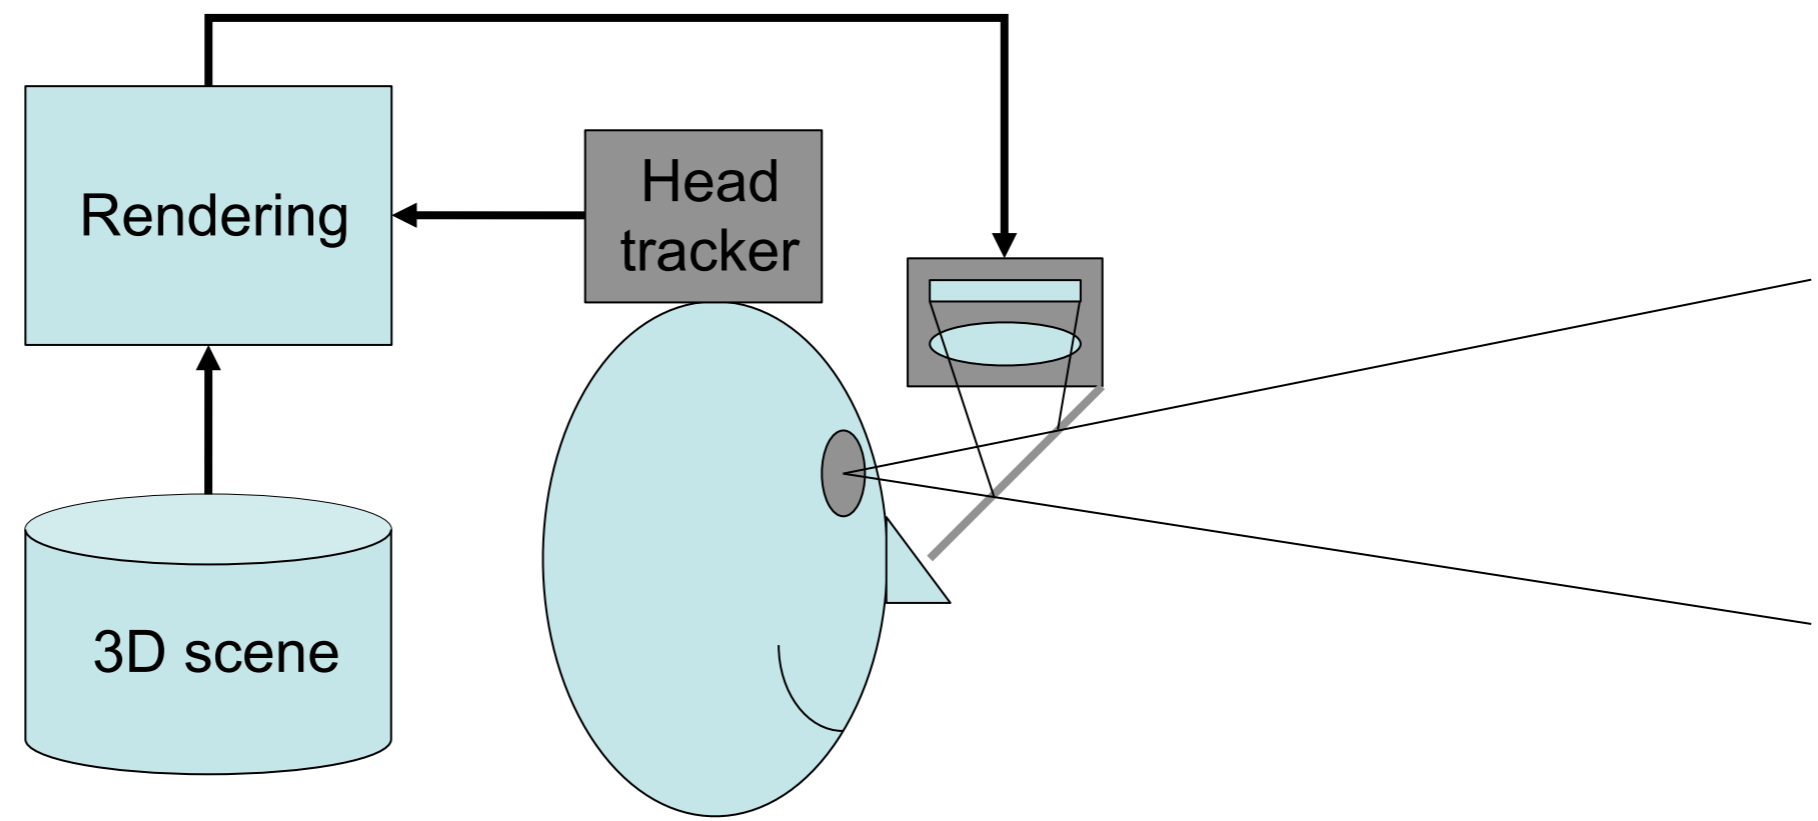

**HMD**

fabrication

teaching

shape-changing

mobile projection

# Advantages of optical see-through

## HMDs

- Preserve the richness of the world
  - Very high resolution of physical image
  - No lag between motion and phys. image
  - Physical objects can be focused at their correct distance
- Limitations:
  - can only add light, i.e. not cover things
  - lag of digital image very noticeable

- applied: PDAs, photo-camera, phones
- elements: two electrodes (one of them transparent), layer of OLED-material
- idea:
  - ‘+’: thin construction allows fabrication of flexible displays on e.g. plastic foil, no backlight, higher contrast ratio
  - ‘-’: not all colors shine with same efficiency, on-going research on optimum OLED-materials
